

Organizing the Provision of Salmon data.

A suggestion by Scott.Akenhead@dfo-mpo.gc.ca

- **Simple datasets** avoid problems. Biologists who collect and know the data hold the responsibility for quality, timeliness, metadata, and caveats.
- **Simple user interfaces** improve accessibility, reduce training requirement (unfunded), increase use cases, reduce requirement for user support (unfunded). They can be many of these.
- **Complexity** is gathered into the business/science models. Responsibility is held by efficient, professional programmers as opposed to biologists. Inappropriate use of raw data minimized (via metadata).
